WebEMIST™

WebEMIST™ is EM-Assist's proven ISO 14001 EMS management tool. The WebEMIST™ software application is a secure commercial off-the-shelf (COTS) solution that delivers the optimal balance between functional capability and ease of use to help organizations achieve their EMS implementation vision in a straightforward, efficient manner. WebEMIST™, which can be deployed in either a Microsoft® SharePoint®-based or Web-based configuration, allows users to:

- › Identify, manage, rate, and rank environmental aspects and impacts
- › Define and identify objectives and targets and associate them with related tasks
- › Centralize, process, and report real-time data, such as greenhouse gas emission credits, wind turbine power output, and water analytical results
- › Generate dynamic Environmental Management Plans (EMPs)
- › Assign, monitor, and manage tasks in detail to ensure accountability to organizations and assigned personnel
- › Perform document management and create an audit trail

WebEMIST™ helps organizations implement the ISO 14001 EMS process and improves environmental management and decision-making by providing current, relevant, and easy-to-use data with dashboard monitoring, roll-up reporting, and an intuitive roles-based user interface. As a single interoperable application capable of connecting to and integrating data from various other data systems (including disparate existing legacy systems), WebEMIST™ centralizes and enhances an EMS to mitigate risk and improve environmental regulatory compliance.

The standard WebEMIST™ application consists of a core set of integrated modules that deliver powerful functionality and full ISO 14001 conformance. The application's modular design offers users the ability to customize and extend standard capabilities through the integration of additional optional modules. Data elements within all modules are inter-connected in a searchable dynamic database.

EM-Assist has implemented WebEMIST™ for both Department of Defense and commercial clients who have users accessing the application from multiple, geographically-dispersed user sites. WebEMIST™ is currently accessible by more than 200 user sites nationwide.
